|--|--|---|----------|----------|
| UNIT NAME | ESTIMATED DURATION | 9 WEEKS | | |
| UNIT 2: NUMBERS AND OPERATIONS/ALGEBRAIC REASONING: MULTIPLICATION AND DIVISION, PATTERNS AND EXPRESSIONS | 5 WEEKS | 1 | 2 | 3 |
| Unit Overview | | | | |
| Connections between operations, the properties and patterns of multiplication and division, proficiency with the basic facts and the development of strategies to solve problems involving multiplication and division with multi-digit whole numbers. | | | | |
| Enduring Understandings | | | | |
| The student will understand that: | <ul style="list-style-type: none"> • A numeric or algebraic expression represents a quantity. • Proficiency with basic facts aids in estimation and computation with larger and smaller numbers. • Multiplication and division can be accomplished through the addition and subtraction of partial products. | | | |
| Concepts | | | | |
| Operation Meanings and Relationships Properties Patterns Numbers Base Ten Number System | <ul style="list-style-type: none"> • The same number sentence (e.g. $12-4=8$) can be associated with different concrete or real-world situations, different number sentences can be associated with the same concrete or real- world situation. • For a given set of numbers there are relationships that are always true, and these are the rules that govern arithmetic and algebra. • Relationships can be described and generalizations made for mathematical situations that have numbers or objects that repeat in predictable ways. • The set of real numbers is infinite, and each real number can be associated with a unique point on the number line. • The base ten numeration system is a scheme for recording numbers using digits 0-9 groups and place value. | | | |
| Guiding/Essential Questions | | | | |
| <ol style="list-style-type: none"> 1. When are algebraic and numeric expressions used? 2. How are real world problems identified that can be solved with multiplication and division? 3. What strategies aid in mastering multiplication and division facts? 4. How can multiples be used to solve problems? | | | | |
| Learning Targets | | Learning Progressions | | |
| <u>Prerequisites:</u> <ul style="list-style-type: none"> • The student will multiply a two-digit number by one-digit number using mental math, properties, & partial products <u>Learning Targets:</u> <ul style="list-style-type: none"> • The student will use patterns in multiplication and division with strategies such as commutative, associative, and distributive properties, mental math and partial products along with standard algorithms, | | <ul style="list-style-type: none"> • Estimate to determine reasonable results • Apply strategies to multiply a 2-digit number by a 1 digit number • Identify each multiplication property <ol style="list-style-type: none"> 1. Commutative property $4 \times 3 = 3 \times 4$ (two numbers can be multiplied in any way to arrive at the same product) 2. Associative property $4 \times (3 \times 1) = (4 \times 3) \times 1$ 3. Distributive property $4 (3 \times 1) = (4 \times 3) + (4 \times 1)$ • See Resources ** | | |

students will multiply up to a 4-digit number by a 1-digit number and 2-digit numbers by 2-digit numbers.

5th Grade Connection:

- The student will multiply with fluency a three-digit number by a two-digit number using the standard algorithm

Prerequisites:

- The student will determine the total number of objects when equally sized groups are combined or arranged in arrays
- The student will represent multiplication facts by using arrays, area models, strip diagrams, and equations

Learning Target:

- The student will model factors and products using arrays, area models and equations, including perfect squares up to 15 by 15

5th Grade Connection:

- The student will multiply with fluency a three-digit number by a two-digit number using the standard algorithm

- Define what a factor is and how factors are used to create products.
- Recognize what an array represents and use it to solve a multiplication problem
- Construct arrays based on the factors and products to model area
- Distinguish the difference between an area model and an array
- Show how an array or area model can be used to represent an equation

Partial Products / Area Models

$$\begin{array}{r}
 23 \times 37 \\
 \begin{array}{r} \wedge \quad \wedge \\ 20 + 3 \quad 30 + 7 \end{array} \\
 \begin{array}{r} \boxed{30} \quad \boxed{7} \\ \hline \begin{array}{|c|c|} \hline 20 \times 30 = 600 & 20 \times 7 = 140 \\ \hline 3 \times 30 = 90 & 3 \times 7 = 21 \\ \hline \end{array} \\ \hline
 \end{array}$$

Equation 1 → $20 \times 30 = 600$
 Equation 2 → $20 \times 7 = 140$
 Equation 3 → $3 \times 30 = 90$
 Equation 4 → $3 \times 7 = 21$

| | |
|--|--|
| <p>Number Line Model</p> <p>$3 \times 5 = 15$ (Three "hops" of five land on fifteen.)</p> <p><i>This is like skip counting.</i></p> | <p>Array Model</p> <p>3 rows 5 stars per row $3 \times 5 = 15$</p> <p><i>Use dots to draw an array quickly.</i></p> |
| <p>Area Model</p> <p>3 in. by 5 in. rectangle Area = 15 in^2 $3 \text{ in} \times 5 \text{ in} = 15 \text{ inches squared}$</p> | <p>Equal Groups Model</p> <p>$3 \times 5 = 15$ 3 flowers, 5 petals per flower, 15 petals in all</p> <p><i>Draw an equal group for each factor.</i></p> |

Prerequisite:

- The student will understand the relationship between place value and numerical value

Learning Target:

- The student will use patterns to multiply by 10 and 100

5th Grade Connection:

- The student will multiply with fluency a three-digit number by a two-digit number using the standard algorithm

- Recognize place value patterns to find products when one factor is 10 or 100.
- Relate the number of zeros in a product to the location in a place value system.

Example:

$$\begin{aligned} 36 \times 94 &= (30 + 6) \times (90 + 4) \\ &= (30 + 6) \times 90 + (30 + 6) \times 4 \\ &= 30 \times 90 + 6 \times 90 + 30 \times 4 + 6 \times 4. \end{aligned}$$

Patterns of 10 and 100

Example:

Multiplying by 104 is multiplying by 10 four times. Multiplying by 10 once shifts every digit of the multiplicand one place to the left in the product (the product is ten times as large) because in the base-ten system the value of each place is 10 times the value of the place to its right. So multiplying by 10 four times shifts every digit 4 places to the left.

SUPER THE POWERS OF TEN

"Powers of ten" describe numbers that are the product of a certain number of 10s.

You could also say that when you use 10 as a repeated factor, the resulting number is a "power of ten."

You might also think about it this way – a "power of ten" is a number made by multiplying 10 by itself a certain number of times.

You can represent a power of ten in a variety of ways.

| standard form | multiplication expression | exponent form | word form |
|---------------|---------------------------|-----------------|--|
| 100 | 10 x 10 | 10 ² | ten to the second power (or ten squared) |
| 1,000 | 10 x 10 x 10 | 10 ³ | ten to the third power (or ten cubed) |
| 10,000 | 10 x 10 x 10 x 10 | 10 ⁴ | ten to the fourth power |
| 100,000 | 10 x 10 x 10 x 10 x 10 | 10 ⁵ | ten to the fifth power |

The exponent tells how many 10s are multiplied to create the number.

You might be wondering about 10¹ and 10⁰.

10¹ = 10
10⁰ = 1

Although this references exponents, you may teach children that when we look at multiples of 10, the pattern is that the number of zeros in the product will directly correlate to the factor of 10 or 100

Prerequisites:

- The student will determine a quotient using the relationship between multiplication and division

Learning Target:

- The student will find whole-number quotients and remainders using a variety of strategies.

5th Grade Connection:

- The student will solve with proficiency for quotients of up to a four-digit dividend by a two-digit divisor using strategies and the standard algorithm

- Arrange a division equation in a variety of ways
- Label the different pieces to a division equation
- Define the purpose of each (quotient, divisor, dividend, remainder)
- Represent the quotient of up to a 3- digit number divided by a 1 digit number with NO remainders
- Identify the remainder in a division equation and that it represents the "leftover"

Example:

There are 592 students participating in Field Day. They are put into teams of 8 for the competition. How many teams get created?

| | | | | | | | | | | | | | | | | | |
|--|---|---|-----|----|------|--|-----|--|------|----|----|--|-----|---|---|--|--|
| <p>Student 1 592 divided by 8 There are 70 8's in 560 $592 - 560 = 32$ There are 4 8's in 32 $70 + 4 = 74$</p> | <p>Student 2 592 divided by 8 I know that 10 8's is 80 If I take out 50 8's that is 400 $592 - 400 = 192$ I can take out 20 more 8's which is 160 $192 - 160 = 32$ 8 goes into 32 4 times I have none left I took out 50, then 20 more, then 4 more That's 74</p> | <table style="border-collapse: collapse; margin-left: auto; margin-right: auto;"> <tr> <td style="border-right: 1px solid black; padding: 5px;">592</td> <td style="padding: 5px;">50</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">-400</td> <td style="padding: 5px;"></td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">192</td> <td style="padding: 5px;"></td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">-160</td> <td style="padding: 5px;">20</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">32</td> <td style="padding: 5px;"></td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">-32</td> <td style="padding: 5px;">4</td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">0</td> <td style="padding: 5px;"></td> </tr> </table> | 592 | 50 | -400 | | 192 | | -160 | 20 | 32 | | -32 | 4 | 0 | | <p>Student 3 I want to get to 592 $8 \times 25 = 200$ $8 \times 25 = 200$ $8 \times 25 = 200$ $200 + 200 + 200 = 600$ $600 - 8 = 592$ I had 75 groups of 8 and took one away, so there are 74 teams</p> |
| 592 | 50 | | | | | | | | | | | | | | | | |
